Mailboxes synchronization

You can synchronize an external mailbox with your Hosterra Email mailbox. This can be useful during a mailbox migration, the migration of an entire domain or simply in everyday life to consult two mailboxes in a single reception space.

To start synchronizing two mailboxes, go to your mailbox administration interface and create a synchronization job:

The first field allows you to specify the Hosterra Email mailbox (destination). The following fields allow you to specify the remote mailbox to be used as the source of the synchronization.

The polling interval indicates the frequency, in minutes, at which this synchronization task will be launched. For migration purposes, we recommend using the lowest frequency (20 minutes). For permanent use, however, you can specify a higher frequency.

> You can suspend or delete a synchronization task at any time. In particular, we advise you to delete all synchronization tasks that have been created for a migration, to avoid any side-

effects when deleting your account with your previous provider.
